## Numerical Analysis MATH50003 (2024–25) Problem Sheet 6

**Problem 1(a)** Show for a unitary matrix  $Q \in U(n)$  and a vector  $\mathbf{x} \in \mathbb{C}^n$  that multiplication by Q preserve the 2-norm:  $||Q\mathbf{x}|| = ||\mathbf{x}||$ .

**Problem 1(b)** Show that the eigenvalues  $\lambda$  of a unitary matrix Q are on the unit circle:  $|\lambda| = 1$ . Hint: recall for any eigenvalue  $\lambda$  that there exists a unit eigenvector  $\mathbf{v} \in \mathbb{C}^n$  (satisfying  $\|\mathbf{v}\| = 1$ ).

**Problem 1(c)** Show for an orthogonal matrix  $Q \in O(n)$  that  $\det Q = \pm 1$ . Give an example of  $Q \in U(n)$  such that  $\det Q \neq \pm 1$ . Hint: recall for any real matrices A and B that  $\det A = \det A^{\top}$  and  $\det(AB) = \det A \det B$ .

**Problem 1(d)** A normal matrix commutes with its adjoint. Show that  $Q \in U(n)$  is normal.

**Problem 1(e)** The spectral theorem states that any normal matrix is unitarily diagonalisable: if A is normal then  $A = V\Lambda V^*$  where  $V \in U(n)$  and  $\Lambda$  is diagonal. Use this to show that  $Q \in U(n)$  is equal to I if and only if all its eigenvalues are 1.

## **Problem 2** Consider the vectors

$$\boldsymbol{a} = \begin{bmatrix} 1 \\ 2 \\ 2 \end{bmatrix}$$
 and  $\boldsymbol{b} = \begin{bmatrix} 1 \\ 2i \\ 2 \end{bmatrix}$ .

Use reflections to determine the entries of orthogonal/unitary matrices  $Q_1, Q_2, Q_3$  such that

$$Q_1 \boldsymbol{a} = \begin{bmatrix} 3 \\ 0 \\ 0 \end{bmatrix}, Q_2 \boldsymbol{a} = \begin{bmatrix} -3 \\ 0 \\ 0 \end{bmatrix}, Q_3 \boldsymbol{b} = \begin{bmatrix} -3 \\ 0 \\ 0 \end{bmatrix}$$

**Problem 3** What simple rotation matrices  $Q_1, Q_2 \in SO(2)$  have the property that:

$$Q_1 \begin{bmatrix} 1 \\ 2 \end{bmatrix} = \begin{bmatrix} \sqrt{5} \\ 0 \end{bmatrix}, Q_2 \begin{bmatrix} \sqrt{5} \\ 2 \end{bmatrix} = \begin{bmatrix} 3 \\ 0 \end{bmatrix}$$

**Problem 4** Use Householder reflections to compute QR and reduce QR factorisations of the matrix

$$A = \begin{bmatrix} -1 & 2 \\ 2 & 4 \\ 2 & 3 \end{bmatrix}.$$

**Problem 5(a)** Show that every matrix  $A \in \mathbb{R}^{m \times n}$  has a QR factorisation such that the diagonal of R is non-negative. Make sure to include the case of more columns than rows (i.e. m < n).

**Problem 5(b)** Show that the QR factorisation of a square invertible matrix  $A \in \mathbb{R}^{n \times n}$  is unique, provided that the diagonal of R is positive.
